

# NUTRAFIX

NutraFix application rates are a function of the percent coverage of the desirable perennial grasses versus the non-desirable annuals, bare ground or weed species. Typical application rates supported by years and numerous test plots is 350lbs of NutraFix per acre. Every site has unique conditions such as varying precipitation rates, presence of thatch, existing seed banks and many other variables that need to be considered. Please contact your local ACF West representative for guidance on application.

NutraFix can be applied either in a pelletized, and in a hydroseeder. It can also be applied with native perennial grasses.

## Product Use Guidelines

NUTRAFIX™	Good	Better	Best
Granular	X	X	X
Liquid			X
